

HDMI Firmware:

The HDMI software updates the Cinema 11a from the current HDMI v1.3 to the most recent HDMI v1.3a.

AUDIO Firmware:

- (1) Enabled the decoder of dts HD-HRA.
- (2) Enabled the decoder of dts HD-MA 192kHz 24bit 5.1ch
- (3) Enabled the decoder of LPCM 192KHz 24bit 2.0ch over HDMI.
- (4) Added ZONE 2 Master Volume preset volume level function.
- (5) Added standby mode when plugged into AC POWER.
- (6) Added “CD Pure Audio mode” in the “ADVANCED SETTINGS” of the “SETUP MENU”. This feature can be set to **OFF** or **ON**. When a 44.1kHz 16 bit CD is played back in the “Off” mode, the audio is being run through your preselected “LISTENING PROFILE”. When CD audio is playback in the “On” mode, the audio signal will bypass the “LISTENING PROFILE” and be played back directly with no effects to the signal. This is to remedy the issue some users were experiencing with audio dropouts between tracks of CD’s when the player was hooked up to the Cinema 11a digitally.
